

Hybrid Info

Our Professional Hybrid Body Paint is extremely durable and can last up to 2 or 3 days. This is the perfect body paint for any event that requires extended durability, water resistance and can still be removed in the shower with liquid soap, warm water, and a bit of scrubbing {or use a little rubbing alcohol for easy removal}. Our Professional Hybrid Body Paint was developed with the true professional body painter in mind for spray-ability, coverage, and durability.

Professional Hybrid Body Paint comes ready to spray right out of the bottle. Do not dilute with water. Simply spray and go. It dries almost instantly and powdering is not necessary. If you need to thin it, you can use use 90% isopropyl alcohol, however we recommend using our Extender product to retain optimum durability. It is best to clean your equipment with denatured alcohol, but 90% isopropyl will work too {it just takes longer}. Standard rubbing alcohol contains too much water. We do not recommend using it except for cleaning the skin prior to application.

Professional Hybrid Body Paint is water-resistant and is perfect for photo shoots and outdoor activities where sweat can cause problems. This paint will not run or rub off. It has to be scrubbed in the shower to get it off, but it will come off with soap & water, unlike our Long Lasting and Quick Dry inks which can only be removed with alcohol. You can also use a makeup remover or rubbing alcohol to speed removal of the paint.

IF YOU USE THE SAME AIRBRUSH FOR WATERBASED BODY PAINTS AND OUR ALCOHOL BASED TATTOO INKS OR PROFESSIONAL BODY PAINT, BE SURE TO RUN DENATURED ALCOHOL THROUGH THE GUN BEFORE CHANGING OVER FROM WATERBASED PAINTS TO ALCOHOL BASED INKS/PAINTS. IT WILL CLOG YOUR GUN IF YOU DON'T DO THIS FIRST.

Follow these simple steps:

1. **Shake the bottle for a minimum of 30 seconds to insure proper dispersion of pigments.**
2. Clean the area of the skin with rubbing alcohol.
3. If using stencils, lightly attach stencil to the skin. (Follow stencil maker guidelines.)
4. Spray the paint in light layers to avoid runs.
5. Repeat step 4 until desired affect is reached. Allow to dry.
6. Carefully remove stencil.

Removing Body Paint:

Because this body paint holds up to moisture, water alone will not remove it. Wipe the area with baby oil, makeup remover or lather the area with liquid soap first [without using water], then rinse with warm water and more soap. For full body painting: lather with liquid soap and no water. Then shower as usual with soap and water. Rubbing alcohol can be added to the soap for quick removal if necessary.

Care:

Avoid applying in areas that will be constantly rubbed by tight clothing.

Air Brush Cleaning:

To make cleaning your airbrush easier, use denatured alcohol. Isopropyl alcohol will work but takes much longer to do a good job.

Rest assured that we only use ingredients that are FDA approved for the skin. Ingredients list and MSDS are available online..

Please let us know if you have any questions. Thank you and good luck.
